## DSC 40B - Discussion 01

---

### Problem 1.

Let  $A$  be a *symmetric*  $n \times n$  matrix, with entries:

$$\begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nn} \end{pmatrix}.$$

Suppose  $\vec{x} \in \mathbb{R}^n$ .

a) Show that  $\vec{x}^T A \vec{x} = \sum_{i=1}^n \sum_{j=1}^n x_i x_j a_{ij}.$

b) Show that

$$\frac{\partial}{\partial x_1} (\vec{x}^T A \vec{x}) = \sum_{j=1}^n x_j a_{1j}$$

### Problem 2.

Consider the **absolute loss**:

$$L_{\text{abs}}(H(\vec{x}), y) = |H(\vec{x}) - y|.$$

For a linear prediction rule  $H(\vec{x}; \vec{w}) = \text{Aug}(\vec{x}) \cdot \vec{w}$ , this takes the form:

$$L_{\text{abs}}(\vec{w}, \vec{x}, y) = |\text{Aug}(\vec{x}) \cdot \vec{w} - y|.$$

Show that a subgradient of  $L_{\text{abs}}$  with respect to  $\vec{w}$  is:

$$\begin{cases} \text{Aug}(\vec{x}), & \text{if } \text{Aug}(\vec{x}) \cdot \vec{w} - y > 0 \\ -\text{Aug}(\vec{x}), & \text{if } \text{Aug}(\vec{x}) \cdot \vec{w} - y < 0 \\ \vec{0}, & \text{if } \text{Aug}(\vec{x}) \cdot \vec{w} - y = 0 \end{cases}$$
